EDUCATION

University of Bergen

PhD in Computational Media Forensics

Bergen, Norway

2021-Present

University of Sheffield

MSc Cybersecurity and Artificial Intelligence

Sheffield, United Kingdom

2018-2020

COMSATS University, Islamabad

Bachelor of Science in Computer Science

Islamabad, Pakistan

2013-2017

Research Interests

I have an MSc in Cybersecurity and Artificial Intelligence from the University of Sheffield, United Kingdom. My research interests lie in the area of artificial intelligence, specifically in image forensics, computer vision. I am interested in employing machine learning/deep learning techniques to solve real world problems in different domains such e.g. IoT, smart cities, health, finance, education etc. Following are some of the topics I am interested to explore and carry out my research:

- Deep Learning for Computer Vision (e.g. deepfake media detection, face forensics and analysis, real-time object detection and image segmentation etc)
- Machine learning / Deep learning for Natural Language Processing Tasks (e.g. natural language understanding, natural language generation, question answering etc)
- Security and Privacy in Machine Learning/Deep Learning (e.g. homomorphic encryption, differential privacy)

My current research intersects image forensics and deep learning. I am working on deepfake media detection and trying to address the issue of poor generalization capability of current deepfake detection systems. I am also working to develop efficient real-time salient object detection systems.

Research Papers

1. **Video Transformer for Deepfake Detection with Incremental Learning:** *Accepted for Publication at ACM Multimedia Conference 2021*
2. **Analysing the Impact of Global Demographic Characteristics over the COVID-19 Spread Using Class Rule Mining and Pattern Matching:** *Published in Royal Society Open Science Journal, Jan 2021*
DOI: <https://doi.org/10.1098/rsos.201823>
3. **Phishing Attacks and Websites Classification Using Machine Learning and Multiple Datasets (A Comparative Analysis):** *Accepted for Publication at International Conference on Intelligent Computing, Oct 2020*
DOI: https://doi.org/10.1007/978-3-030-60796-8_26

Experience and Certifications

Research Assistant at 3d Vision Lab, Mohamed Bin Zayed University of Artificial Intelligence, Abu Dhabi, UAE, December 2020 - May 2021:

-> I worked under the supervision of **Dr Hang Dai**. Our work intersected image forensics, deep learning, computer vision and is accepted for publication at ACM Multimedia 2021.

Research Assistant (Intern) at DeepCamera Research Lab, CYENS Centre of Excellence, Nicosia, Cyprus, September 2020 - December 2020:

-> Worked under the supervision of **Dr. Alessandro Artusi** on deepfake media detection and adversarial machine learning.

Internship Experience UK, July 2020:

-> Fortune 500 companies such as, Amazon, Goldman Sachs, Bloomberg, Google, Vodafone, GSK, Accenture etc participated in the program. The purpose of the internship was to experience what it is like to work in a fortune 500 company, and what daily tasks might look like.

Cybersecurity Fundamentals: Certified by IBM, August 2020:

-> This certification certifies that the earner of this certification demonstrates a foundational understanding of cybersecurity concepts, objectives, and practices. This includes cyber threat groups, types of attacks, social engineering, case studies, overall security strategies, cryptography, and common approaches that organizations take to prevent, detect, and respond to cyber attacks. This also includes an awareness of the job market.

Completed Projects

Video Transformer for Deepfake Detection with Incremental Learning.....

I developed a novel video transformer for deepfake videos detection with incremental learning capabilities. To better align the input face images, I employed a 3D face reconstruction method to generate UV texture from a single input face image. The aligned face image lacks pose, eyes blink and mouth movement information that cannot be perceived in the UV texture map, to handle this issue, I used both face images and their UV texture maps to extract the image features. Furthermore, to keep track of intra-frame discrepancies in fake videos, I modified Google's Vision Transformer to handle sequenced data. I add novel sequence embeddings along with positional embeddings to help model learn rich features from provided data.

The proposed models are fine-tuned using incremental learning strategy on a tiny amount of data and achieve better deepfake detection performance. The comprehensive experiments on various public deepfake datasets demonstrate that the proposed video transformer model with incremental learning achieves state-of-the-art performance in the deepfake video detection task with enhanced feature learning from the sequenced data.

Phishing Websites Classification Using DL/ML (MSc Dissertation).....

In my MSc dissertation, I did a very detailed survey of the previously proposed techniques and also, developed a new phishing websites classification system, which uses Neural Networks as well as some traditional Machine Learning algorithms, such as, Decision Trees, Support Vector Machines, K-Neighbors Algorithm. I used three different feature selection methods along with PCA for dimensionality reduction, to compress feature space. Besides PCA, I have employed Deep Autoencoder for dimensionality reduction, which is an unsupervised neural network able to learn

efficient data encoding. This project basically aims to present an in-depth comparison on how well traditional machine learning algorithms perform, in comparison with the deep learning based algorithms. This research also studies how well the algorithms perform on selected set of features and how well does the feature selection methods work in comparison to dimensionality reduction. In this project, I used three different phishing websites datasets to train my models.

Flood Detection from Images using Deep Learning.....

I employed Deep learning library KERAS and fine-tuned its MobileNet CNN for binary image classification task. The model accuracy was more than 98% after being trained on about 300 images for 10 epochs.

-> **Project Link:** <https://github.com/sohailahmedkhan173/Flood-Detection-from-Images-using-Deep-Learning>

Adversarial Attack on Fine-Tuned Flood Detection Model.....

This is basically an implementation of FGSM (Fast Gradient Sign Method) attack on my fine-tuned MobileNet architecture trained for flood detection in images.

-> **Project Link:** <https://github.com/sohailahmedkhan173/Adversarial-Attack-on-Fine-Tuned-Flood-Detection-Model>

Named Entity Recognizer.....

The goal of this script is to learn a named entity recogniser (NER) using the structured perceptron algorithm. For each word in a sequence, the named entity recogniser should predict one of the following labels:

- O: not part of a named entity
- PER: part of a person's name
- LOC: part of a location's name
- ORG: part of an organisation's name
- MISC: part of a name of a different type (miscellaneous, e.g. not person, location or organisation)

I also implemented dynamic programming methods such as Viterbi, Beam Search, which the script uses to accelerate the process of training the Perceptron.

-> **Project Link:** <https://github.com/sohailahmedkhan173/Efficient-Named-Entity-Recognizer-using-Structured-Perceptron-Viterbi-and-Beam-Search-Python>

XSS / SQL Fuzzer in Python.....

A very basic Fuzzing tool, to fuzz web applications with some predefined Static and then Dynamically generated Payloads. The tool is tested on a particular web application, and has statically defined endpoints to test, but it can be updated to crawl for the potential endpoints with a little effort.

-> **Project Link:** <https://github.com/sohailahmedkhan173/Simple-SQL-XSS-Fuzzing-Tool-PYTHON->

TOOLS & SKILLS

Some Tools I am familiar with:

- TensorFlow
- Keras
- PyTorch
- OpenCV
- FastAI
- Sci-kit Learn
- Python
- Apache Spark
- NLTK
- Spacy
- FastText
- Latex
